

ABSTRACT

A method and/or apparatus to permit non-authorized wireless mobile devices access to public domain services of a local area network. One embodiment of the invention provides a wireless access point device, with a wireless port and a wired network port, with at least two modes of operation to permit authorized mobile devices access to network services and non-authorized mobile devices access to a particular set of network services. A list of free and/or pay-per-use network services is provided to non-authorized mobile devices to select the desired service(s). For pay-per-use services, a mobile device user can provide a form of payment for validation.
